ERP System Overview and User Manual

Page 1: System Overview

The Jixels ERP system is a phone business management platform that connects Head Office, Admin, Branches, Agents, and Departments into one working system. It manages stock, sales, approvals, reports, payroll, finance records, notifications, and shared operational data.

Main goal: allow every authorized user to work from the same ERP data so stock, sales, accounts, approvals, and reports stay consistent across the organization.

Main Modules

- Director portal for company-wide supervision and read-only department access.
- Admin portal for approvals, stock governance, exports, and data deletion.
- Branch portal for stock entry, damage/loss records, transactions, charts, and reports.
- Agent portal for approved sales transactions under a branch.
- Departments for HR, Finance, Sales, Operations, and Admin workflows.

Page 2: User Roles and Access

Each portal is role-based. Users should only access the portal assigned to their responsibility.

Director

Views company performance, branch data, reports, finance summaries, and department pages in read-only mode.

Admin

Approves users, manages branch stock, exports JSON, clears system data, and generates admin reports.

Branch

Manages inventory, records damage/loss, views transactions, and generates branch reports.

Agent

Sells phones after approval and records completed transactions for the assigned branch.

Department Roles

- HR manages employees, debts, and payroll forwarding.
- Finance reviews payroll, payment status, and money reports.
- Sales views sales performance and inventory movement.
- Operations monitors stock, branch activity, damage, and loss.

ERP System Overview and User Manual

Page 3: Login, Registration, and Approval

Users create accounts from the correct portal. Branches and agents cannot fully access the system until Admin approves their accounts. This protects the system from unauthorized access.

Registration Flow

1. User opens the correct registration page.
2. User enters username, email, password, and required role or branch details.
3. The account is saved as pending.
4. Admin opens Accounts and Approvals.
5. Admin approves or rejects the account.
6. Approved users can log in with the same credentials.

Once an account is approved, the system shows an approval success message and the user can log in.

Security Rule

An agent or account identity should not be reused in another portal after registration.

ERP System Overview and User Manual

Page 4: Admin User Manual

The Admin portal controls users, approvals, stock entry, exports, and data governance.

Admin Tasks

- Add phones to a selected branch using model, color, storage, serial number, and price.
- Approve, reject, or delete branch, agent, and department accounts.
- Generate admin inventory reports for all time, this month, or this year.
- Export all ERP data as JSON for backup or migration.
- Delete all data after typing the required confirmation phrase.

Important: before deleting all data, Admin should export JSON first. Deletion clears ERP, HR, accounts, audit records, notifications, and SMS queues.

Admin Reports

Admin reports include branch inventory, added phones, added value, sold phones in period, and sales value.

Page 5: Director User Manual

The Director portal is for supervision. Director sees all operational data but should not directly change department data from department pages.

Director Can View

- Company overview and KPIs.
- Inventory by branch.
- Branch reports and company reports.
- Finance, HR, Sales, and Operations pages in read-only mode.
- General, weekly, monthly, and yearly company reports.

Director Read-Only Rule

When Director opens a department portal, edit buttons and write actions are blocked. Director can still view, search, generate reports, download Word reports, and print or PDF reports.

Jixels Technologies

ERP System Overview and User Manual

Page 6: Branch User Manual

Branch users handle physical stock and local branch operations.

Branch Tasks

- View assigned branch stock and KPIs.
- Add or manage branch inventory where permitted.
- Record damaged or lost phones.
- Record completed sales transactions.
- View charts and transaction history.
- Generate reports for all time, this month, or this year.

Branch Reports

Branch reports show stock, sold phones, period sales, period revenue, damage/loss records, and transaction records. Reports can be downloaded or printed.

Jixels Technologies

ERP System Overview and User Manual

Page 7: Agent User Manual

Agents sell phones and submit transactions under their assigned approved branch.

Agent Process

1. Agent registers with branch selection and identity details.
2. Admin approves the account.
3. Agent logs in using the same approved credentials.
4. Agent selects or confirms phone details.
5. Agent records customer and payment details.
6. System updates stock, sold phones, and transaction records.

Agent sales affect Branch, Director, Finance, Sales, and Operations reports because they update the shared ERP state.

Page 8: Departments User Manual

Departments work with shared ERP data while keeping their responsibilities separate.

HR Department

- Add and manage employee records.
- Manage salary, debts, and payroll queue.
- Forward payroll items to Finance.

Finance Department

- Review payroll queue items.
- Approve or reject finance reviews.
- Track paid and pending payments.
- View M-Pesa, bank, transaction, and payroll reports.

Sales and Operations

Sales and Operations monitor stock, sold phones, branch activity, damage/loss, and performance reports.

ERP System Overview and User Manual

Page 9: Reports, Export, and Data Governance

The system includes report generation and export features to support management decisions and record keeping.

Report Periods

- All time: complete report from all available records.
- This month: report filtered to the current month.
- This year: report filtered to the current year.
- Director also has weekly, monthly, and yearly company reports.

Exports

Admin can export JSON containing ERP data, HR data, all accounts, audit events, notifications, notification state, and SMS queue data. Reports can also be printed or downloaded as Word documents where available.

Export JSON should be used before deleting data, before migrations, and before connecting a new production database.

Page 10: Deployment, Sync, and Future Database

The system currently runs as a frontend with IndexedDB/browser fallback and Vercel-ready API routes. GitHub Pages is useful for static preview, but it cannot share live data between devices because it has no backend.

Vercel Deployment

- Deploy the project to Vercel to run API routes.
- Add Safaricom Daraja keys for M-Pesa STK Push.
- Add OneSignal keys for notifications and SMS routes.
- Add shared storage keys such as KV_REST_API_URL and KV_REST_API_TOKEN.

Future Database

For production, connect a real database such as Vercel KV, Upstash Redis, PostgreSQL, Supabase, Firestore, or another managed database. The system is prepared so the frontend can continue using the same shared API layer.

Final recommendation: use Vercel for hosting and API routes, then add a persistent database for full cross-device consistency.
